

# $B^+$ \* \* \* \* \*

April 3, 2009

The  $B^+$  is the lightest charged meson containing a bottom quark. The mass and lifetime are well measured. It decays weakly and many of the decay modes are known, however these are not sufficient to saturate the total rate. We have therefore chosen to use the data from [?], together with more recent experimental results not included in [?], and some theoretical calculations to construct the majority of the inclusive modes. Some additional modes are added to saturate some more exclusive measurements. The remainder of the decays are modelled using partonic decays.

The decays to  $D^{(*)}D_s^{(*)}$  are chosen to saturate the total rate 10.93% taken from [?] . Due to our choice of modes we have a lower value, 6.9%, for the  $D^{(*)}D_s$  rate than the result from [?] . However given the error on this result and the total  $D^{(*)}D_s^{(*)}$  rate this is consistent with the experimental measurement.

The  $B^+$  has mass 5279 MeV and is unstable. The  $B^+$  has spin 0, charge 1 and is colour neutral. The  $B^+$  is a meson and is from the  $1^1S_0$  multiplet. The properties of the particle and its antiparticle are taken to be independent. The decay length is 0.000501 m. The PDG code is 521.

0.2744378370	**	on	$u, d, \bar{c}, u$	Decay of $B^+$ with branching ratio taken from EvtGen. This mode has minor modifications to ensure the total branching ratio is one and results from combining two modes from EvtGen due to the different modelling of partonic decays in Herwig and PYTHIA. Table 1: The decay modes of the  $B^+$ .

The  $B^+$  decay modes are given in Table 1 and the total branching ratio is 0.999999999999999.

There is no mass generator for the  $B^+$ . There is no width generator for the  $B^+$ .

The particle was checked by Peter Richardson at 8:46:58 on the 16th of May 2008. The most recently changed decay mode was modified at 8:44:59 on the 16th of May 2008. The particle data was last modified at 14:33:4 on the 15th of May 2008.
